# Apple Management Designed for the Enterprise

Most organizations are experiencing a growing number of Macs as well as workers using Apple iOS devices in a variety of departments and locations. If you or your team is expected to manage Macs and Apple devices along with everything else, the trend is toward managing all endpoints as part of a unified endpoint management strategy.

*\* Ivanti Workspaces is highly customizable and customers' configurations will vary*

## Gain Visibility and Control of Macs and Apple Devices

IT organizations need a broader picture of what's in their environment, a deeper look at their risks, and visibility into how devices are being used. Ivanti solutions give you the needed insights about your Macs and iOS devices in a context to take action.

## Improve User and IT Productivity

Ivanti automates IT tasks on Macs to drive productivity for IT, while providing a more modern experience for all users. Save IT administrators from jumping between multiple consoles and free up their time to work on more business-related initiatives.

## Keep Macs Secure and Applications Up-to-Date

Macs are not impervious and the applications that run on them can also come under attack. Keep everything updated while preventing virus attacks, security vulnerabilities, user-initiated configuration changes, and other issues that impact your security stance.

## Control Assets, Compliance, and Costs

Boost your level of control over business risks and costs due to fines, true-ups, overbuying licenses, adherence to corporate service level agreements, and excessive energy consumption that affect your budget and the bottom line.

## Unify Endpoint Management Processes

Make configuration changes or push packages to a user, and let Ivanti push them automatically to whatever devices they have—Macs, iPads, iPhones, or other PC and mobile platforms.

## A Comprehensive View of IT Activities and Success

Where others struggle to deliver basic reporting, with Ivanti you'll see dashboards, data visualizations, reports, alerts about your IT environment, and discovery of user-owned or rogue devices. Experience role-based workspaces for IT analysts, administrators, asset managers, and security administrators that deliver a modernized view of user and device-related information—integrated with the actions each role requires.

## Provide Self Service Apps and Content

Ivanti Workspaces for the End User offers workers everything they need to interact with IT and access corporate-approved apps, assets, content, and services in one place—on their Macs and iOS devices.

## Control Macs Remotely and Securely from Multiple Devices

With a universal HTML 5-based remote control, Ivanti enables IT teams to work together to solve user issues by controlling the Mac computer remotely from any device. Security measures are built in to ensure that only certain IT people can access a user's device, and that users are fully aware of anyone controlling their device.

## Roll Out Automated Software and Patch Projects Faster

Deploy to thousands of machines in mere minutes. Organize, automate, and roll out the operating systems, software distribution, and patching projects to users in different groups throughout multiple deployment stages. This capability is especially helpful for maintaining the release cadence for Mac OS X patches and third-party software updates.

## Streamline Provisioning and Deployments

Use provisioning templates to automate your upgrade processes, including communications with users, laying down all supported and licensed applications, and standardizing your Mac OS X images. Enrollment is even easier with Apple's Device Enrollment Program (DEP) support across Mac and iOS devices.

## Manage and Reclaim Software Licenses

Deliver software license usage and entitlement information at a moment's notice. Also see how individuals are using their software to reclaim unused licenses and allocate where needed. Maximize your organization's software licenses and enable users to make license requests for authorized software. Plus, deploy software to Macs and iOS devices faster with Apple's Volume Purchase Program (VPP).

## Increase Network Efficiencies

Unlike other solutions, Ivanti requires far less network bandwidth in a distributed organization. Using advanced peer downloading technologies, you only need to push packages across the network once. A computer on each subnet acts automatically as a local server for other devices on each subnet.
