

Identity, Access, and Governance for a Modern World

Technology trends such as cloud and mobile have transformed the way IT delivers services to the business. But these new technologies also complicate IT's ability to manage identities and access and introduce new challenges around employee productivity. Without an automated way to manage identities, IT has a difficult time enforcing complex access policies within hybrid environments.

Balancing Access Controls and Productivity

Rising security risks and corresponding government regulation around data protection and internal governance policies make it more important than ever for IT to prioritize identity and access management. By automating everything, from managing privileged access to the onboarding and offboarding of workers based on identity, IT can balance their responsibility of meeting compliance and governance requirements while providing workers with more flexibility than ever before.

Ivanti Identity Director, powered by RES provides an attribute-based approach to identity and access with automated provisioning, workflows, and self service. With Ivanti, workers have the right levels of access based on their identity, giving them the ability to stay productive while the business remains secure.

A central identity warehouse aggregates from existing systems, so IT can automatically deliver predictable services to the business when they are needed or workers can use self service supported by automated workflows. Ivanti improves IT efficiency and service quality, streamlines employee onboarding and offboarding, and gives IT the insight it needs to meet governance and compliance standards.

Key capabilities include:

Access Control – Manage access based on identity attributes and context-aware policies to keep workers productive and secure

Automated Delivery and Return – Automate the delivery of predictable services to the business when needed, based on policy and workflows

Self Service – Deliver services to the business when requested via a self-service portal or mobile app

Flexible Administration – Simplify the management of the complex hybrid environment

Governance – Reduce risk and ensure compliance through insight, visibility and analytics

One Solution, Many Uses

A user's identity is central to many other aspects of enterprise IT. The automation of tasks and workflows associated with managing identities and access brings many benefits. Ultimately, Ivanti Identity Director, powered by RES can improve IT's ability to enable worker productivity, mitigate security and compliance risks, and efficiently deliver support and services to the business. Common ways enterprises leverage the technology include:

Attribute-based identity management: Provide a single identity store that aggregates from existing data sources and offers IT the ability to provision the right access to services and apps, based on identity attributes. Adapt access based on attribute privileges throughout the entire identity lifecycle.

Security risk mitigation: Drive workforce enablement to give workers the freedom to work their way but also remain secure. Automating the provisioning and de-provisioning process will eliminate human error and enforce security policies by streamlining the delivery of services to avoid the need for workers to turn to "shadow IT."

Auditable compliance: Support demonstrating compliance with regulatory data protection standards such as GDPR, HIPAA and PCI. Easy access to the audit-trail and reports during the sampling process simplifies the audit reporting and reduces the manual attestation tasks associated with meeting governance requirements.

User self service: Provide intelligent provisioning for IT to drive business processes and policies via automated workflows. Offer self service and a mobile app for workers to request access and other common IT services. The result is shared ownership between IT and the business and visibility into workflow requests and approvals to enforce policy.

Hybrid infrastructure automation: IT can consolidate, control, and enforce access privileges, no matter where apps are hosted. With the visibility to centrally troubleshoot in a hybrid environment, you are also future proofed with automation to simplify infrastructure or process changes.

As your company and your people become increasingly dependent on IT services, conventional approaches to managing identities and access and providing services to users just don't cut it. By implementing Ivanti Identity Director powered by RES, your company can handle the intensifying requirements with ease, efficiency, and excellence.
